- Given a string containing ONLY characters 0-9 inclusive
- An integer is "good" if the following conditions are true

  1.) Substring length is 3
  2.) All characters are the same

Find the largest "good" integer in the input

Given: "000462777"

In a loop, loop over each substring of 3

l = ["000", "004", "046", ..., "777"] This is O(n) but iterating x3

In each value of new generated list

```
for ( sub : l)
    if ((sub[0] + sub[1] + sub[2] /3) == 1)
        ans = max(sub, ans)
return ans
```

To reduce space, we can read input instead of generating a new list
